UNIVERSAL WASTE MANAGEMENT

THANKS TO RØDE KORS BRABRAND

At Røde Kors Brabrand, many different languages are spoken among the volunteers, which creates confusion when sorting waste, as not everyone understands the signs for the different types of waste.

To understand the scope of the problem and the volunteers' perspectives, we conducted field studies with observations and follow-up questions, and we held a co-design workshop to uncover the volunteers' needs in relation to a solution.

We have developed a prototype of a handheld scanner that uses machine learning and symbolic language to guide the user towards correct waste sorting

ML-SCANNER
